Automation, system integration, and a unified digital platform. Built right, from the start, so your team never has to unlearn bad habits

This project encompasses multiple properties, systems, and departments. Below is what we took away from our recent conversation. It forms a starting point but we will need to go deeper on several areas before building.

Everything Under One Umbrella

The core goal is a single, joined-up system from day one. Opera, Sage, email, bookings, contracts, finance. All connected from the start, not bolted together later.

Start Without the Manual Work

In your previous role, bookings arrived by email, were printed out and their contents entered by hand. Rates went out in spreadsheets. With the sites opening in November, there is an opportunity to make sure that pattern never starts here. Staff will come on board with good practices from the beginning.

Email Is the Nervous System

The majority of the business will run via email – contracts, bookings, rate requests, offers. If we make the email system smart before the first booking comes in, the team will never have to learn the old way of doing things.

Centralization Is the Direction

You are building a head office that centrally manages reservations, sales, marketing, HR and finance. Everything we build must support that structure and operate harmoniously with it.

Marriott Is a Constraint

The Courtyard is enfranchised. Marriott Residences is coming. There are on-premise requirements and brand standards to work within. Whatever we build must sit alongside that and not conflict with it.

Reliability Over Cleverness

You said it clearly: if something breaks on a Friday, you need an answer on Friday, not Monday. Support, uptime and maintenance matter more than fancy features.

This proposal is based on our current understanding. We aim to confirm, correct, and fill in gaps as discussions proceed.

What We Need to Know

To properly scope and deliver this, we will need detailed information from each department. That will entail structured interviews with the people who run the day-to-day, with an eye to fully understanding the following:

How tour operators will communicate with you and how bookings, rates, and contracts will flow through the enterprise
Where the ‘source of truth’ for pricing will live, whether that be Opera, a spreadsheet, or something else entirely
Which systems need to be connected and what the data flows between departments should look like
Purchasing workflows, supplier relationships, and how stock control will work across outlets
Marriott compliance requirements and where these will intersect with WESS-branded properties

Once we have this picture, every system we build will be fed from a single source. If someone updates a rate at 9AM, it is everywhere by 9:01.

We can begin this process remotely, and if we move forward together, an on-site visit to Mauritius would make sense for going deeper into the operation firsthand.

What We Can Do Immediately

With the sites opening in November, the timing is ideal. Here is what we can deliver right away and how we would phase it.

Ready before you open

These systems can be built now so they are in place when the team arrives. Staff will learn the right way of doing things from day one.

Tour Operator Email Agent

When the tour operator emails start coming in, the system will already be in place. It reads them, pulls the right rate, drafts the right response. Your team will start with it from their first day, not as a change they have to adopt later.

Website with Booking Integration

The website can be live before November. Hotels, villas, beach properties, connected to whatever booking engine you go with so guests can book online from launch day instead of having to call.

Guest App and Digital Concierge

Custom-built. Room service, spa bookings, restaurant reservations, local experiences – all from the guest's phone. This will sit on top of your operations and does not depend on back office workflows.

WhatsApp and QR Ordering

Guest-facing tools that work on their own. Pre-arrival messaging, scan-to-order menus. Each one is standalone and can be deployed quickly.

Functions that will require additional discovery

These will integrate into the core of your operation. To deliver them properly, we will need to understand the specific data flows, rate structures, and approval chains across WESS.

Opera-to-Sage Integration

Which version of Sage? How does the night audit work? What gets posted where? What is the chart of accounts? Every hotel group does this differently. We will need to fully comprehend yours.

Channel Manager Setup

What are the rate structures? Seasonal, contract, promotional? How do allotments work? How are rates currently sent out, and to whom? The channel manager must mirror how the business actually operates.

Purchasing and Inventory System

Who approves purchase orders? What is the supplier flow? How does receiving work across outlets? The replacement must match how your F&B and procurement teams actually operate.

Central Dashboard and Dynamic Pricing

What numbers do you need to see at 9AM? What data sources exist across the properties? What are the contract rules for seasonal pricing? These are only useful if they reflect the actual business.

Both tracks run at the same time.

We can start building the things on the left while we run the discovery sessions needed for the things on the right. Nobody will be waiting around.

The Inbox That Runs Itself

An AI agent that monitors your hotel inbox around the clock. It reads tour operator emails, pulls the correct rates from Opera, and drafts a tailored response. Your reservations team starts with this as their normal, not as something they must adapt to.

Email arrives
AI reads & classifies
Pulls rate from Opera
Drafts reply
Sends or queues for review

Rate Offers & Contracts

Automatically sends rate offers, contract updates, and special offers to your full list of tour operators when triggered

Version Tracking

Knows exactly which tour operator has which version of the rates, so you always know who has the latest price

Discrepancy Detection

If British Airways Holidays has a different price to what's in Opera, the system will catch it before the guest arrives

Tour Operator

Email Agent

An AI system that monitors your hotel inbox around the clock. It reads tour operator emails, classifies their intent, pulls the correct data, and drafts responses. Your team reviews and sends, or the system sends autonomously once trust has been established.

How It Works

Step-by-Step

Every email that arrives is processed through a structured pipeline. The agent classifies, retrieves, and drafts with full traceability.

Email arrives in inbox
→
AI classifies intent
→
Pulls correct data
→
Drafts response
→
Sends or queues for review

Intent Classification

The AI reads the incoming email and classifies it: booking request, rate query, contract update, availability check, special offer, or general enquiry. Each category triggers a different processing path.

Data Retrieval

Based on intent, the agent pulls the relevant data: rates from Opera, availability from the channel manager, contract terms from the rate sheet database. Every figure comes from a verified source.

Response Drafting

The agent composes a response using the correct data, matching the tone and format your team already uses. Rate sheets, contracts, and confirmations are generated and attached automatically.

Human-in-the-Loop

Every draft starts in a review queue. Over time, routine responses (availability confirmations, standard rate replies) can be set to auto-send. Complex queries always stay in the queue.

What It Handles

Every TO Communication, Covered

Rate Requests: Tour operator asks for current rates for a specific period. The agent pulls the correct seasonal rate from Opera and responds with the formatted rate sheet.
Booking Confirmations: Reservation request comes in. The agent checks availability, confirms the booking in Opera, and sends the confirmation back to the TO with all relevant details.
Contract Negotiations: When a TO proposes rate amendments or new terms, the agent flags it for human review with full context: current contract terms, proposed changes, and historical rates with that operator.
Special Offer Distribution: When you create a new promotion or early bird offer, the agent sends it to your entire TO list, personalized per operator, with the correct rates for their respective market segment.
Availability Queries: “Do you have 3 Superior rooms 15–22 December?” The agent checks Opera in real time and responds within minutes, not hours.

Version Tracking & Audit Trail

Who Has What Rates

Knowing which tour operator has which version of your rates is one of the biggest operational headaches. The email agent solves it.

Rate Version Registry

Every rate sheet sent is logged: which version, when, who opened it. You always know which operator has which prices.

Outdated Rate Alerts

When you update rates, the system flags every tour operator still working off the old version. It can automatically send update notifications, or queue them for your team to review first.

Why this matters: Right now, if you update your rates in November for the upcoming high season, there’s no easy way to know which of your 50+ TOs received the new rates and which are still quoting the old ones. The agent tracks every version, every send, every acknowledgement.

Discrepancy Detection

Catch Mismatches Before They Cost You

TO sends booking at price X
→
Agent checks Opera rate
→

Mismatch detected
→
Alert raised before guest arrives

The “Ping Pong” Problem, Solved

A tour operator books a room at a rate that doesn’t match Opera. Today, this gets discovered at check-in or during month-end reconciliation. The email agent pre-empts this by cross-checking every incoming booking against the contracted rate and flagging discrepancies immediately. Resolution happens in the email chain, not at the front desk.

Catches wrong room category pricing (e.g., TO charged Standard rate for a Superior room)
Detects outdated seasonal rates being applied (e.g., low-season price used during high-season dates)
Flags supplement discrepancies (meal plans, transfers, special requests billed incorrectly)

How It Learns

Gets Smarter Over Time

Starts with Templates

We load your existing email templates, rate sheet formats, and standard responses. From day one, the agent matches your team’s style and language.

Learns from Edits

Every time your team edits a draft before sending, the agent learns from the correction. If Sarah adds a specific line for German tour operators, or Peter prefers a different closing for long-standing partners, the agent picks up on these patterns and incorporates them.

Continuous Improvement

Over time, the queue shrinks. Routine responses that pass review without edits get promoted to auto-send. Complex cases stay in the queue. Faster without being reckless.

What we will need from the Process Map

To Build This Right

Process Map Required

To build the email agent accurately, we need to understand the email flow in precise detail. This will come from your team during the process mapping phase.

Which mailboxes? How many inboxes handle TO communications? Is it per property, per person, or centralized?
Who handles what? Which team members handle which types of email? Are there specialists for specific markets or operators?
What systems provide the data? Where do current rates live? Opera? Excel? A combination thereof? Which is the source of truth?
What's the approval flow? Which responses require manager approval? Which can the team send directly? What are the escalation rules?
What templates exist? Current email templates, rate sheet formats, contract templates; these become the agent's starting knowledge.

"When I saw your mail system, that out of the mail system he's grabbing... another planet."

— Peter Edler

Bookings Flow Automatically

In your previous role, bookings arrived by email, got printed out and entered into Sage by hand. The connector will stop that pattern from starting here.

Booking confirmed in Opera
Connector maps data
Invoice appears in Sage
Rate reconciliation runs

Zero Manual Entry

From the first booking, when it is confirmed in Opera, the invoice data will appear in Sage without anyone touching it. Your finance team will never learn the print-and-retype routine. It just works.

Rate Reconciliation

Automatically cross-checks that the price in Opera matches the one the tour operator invoiced. Catches the "ping pong" problem before it hits finance.

"The booking is coming in by mail. Then I print it out, and I put it in... like we had it in my old hotel group, and then we put it in by hand again." That was previously the case. The connector ensures that pattern never starts here.

— Peter Edler

Opera to Sage

Integration

Eliminates manual data entry between your PMS and accounting software. Bookings flow from Opera to Sage automatically. No printing, no retyping, no errors.

The Problem Today

Where the Errors Start

The current workflow: A booking arrives by email. Someone prints it out. Someone else enters it into Sage by hand. Every step is an opportunity for errors: wrong room, wrong date, wrong rate, wrong name. These compound through month-end, and finance spends days reconciling.

Booking email arrives
→
Printed out
→
Typed into Sage manually
→
Errors accumulate
Multi-property groups typically spend **$15,000–30,000/month** on manual PMS-to-accounting reconciliation
Manual entry error rates in hospitality accounting typically run at **2–5%** of all transactions. Each error takes 15–30 minutes to resolve
Month-end close for multi-property groups without automation averages **5–7 working days**: with automation, it drops to 1–2 days

How the Connector Works

The Automated Pipeline

Booking confirmed in Opera
→
Connector reads booking data
→
Maps to Sage chart of accounts

→
Creates invoice automatically
→
Reconciliation runs

Data Extraction

The connector monitors Opera for confirmed bookings and extracts the full dataset: guest details, room type, rate code, dates, supplements, meal plans, and billing instructions.

Account Mapping

Each Opera field maps to the correct Sage account code. Room revenue goes to the right category. Meal plans are split correctly. Taxes are calculated automatically. Configured once during setup, centrally maintained.

Invoice Generation

Sage invoices are created automatically with correct line items, dates, and amounts. No human touches the data between Opera and Sage. Ready for review, not retyping.

Continuous Reconciliation

The connector continuously reconciles. If a rate changes in Opera after the invoice was created, the system flags it. If a booking is modified or canceled, Sage updates automatically.

What Gets Automated

End-to-End, Hands-Free

Invoice Creation: Every confirmed booking generates a corresponding Sage invoice with correct account codes, amounts, and dates. No manual entry.
Rate Reconciliation: The connector cross-checks the rate the tour operator invoiced against the rate in Opera. Mismatches are flagged before they hit the finance department.
Payment Matching: When payments arrive, the system matches them against outstanding invoices. Partial payments, overpayments, and short-pays are all tracked and flagged.
Night Audit Posting: End-of-day postings from Opera flow into Sage automatically. Room revenue, F&B charges, sundries. Everything posts to the correct account without manual intervention.
Multi-Property Consolidation: Data from all WESS properties flows into a single Sage dashboard, giving the head office a consolidated financial view without waiting for individual property reports.

Error Prevention

Catches Problems Before Finance

Category Mismatch Detection

If a booking comes in as “Superior Sea View” but the rate code maps to “Standard Garden,” the connector flags it. These mismatches are the ones that cause the most painful reconciliation issues at month-end.

Date Validation

Check-in and check-out dates in the booking are validated against the invoice period. Catches the common error where a booking spans two billing periods but is invoiced to only one.

Rate Discrepancy Alerts

When the tour operator’s price doesn’t match Opera’s contracted rate for that operator, the system raises an alert immediately, not at month-end. Resolution happens in real time.

Duplicate Prevention

Every transaction is tracked by a unique ID. If the same booking is processed twice, the system catches it before a duplicate invoice is created in Sage.

What We Need from the Process Map

This Needs Your Accounting Workflow

Process Map Required

We cannot build this without understanding the specific accounting workflow at WESS. We will need to see how data currently moves from Opera to Sage before we automate it.

Which Sage version? Sage 50, Sage 200, Sage X3? The connector architecture depends on the specific version and its API capabilities.
Chart of accounts structure: How is the chart of accounts organized? By property, by department, by revenue type? The mapping layer needs to match your existing structure.
Night audit process: What happens at end-of-day? What reports are generated? What data gets posted where? This determines the nightly sync logic.
Multi-property handling: How are the different WESS properties represented in Sage? Separate companies? Departments within one company? Cost centers?
Current pain points: Where specifically do errors happen the most? Which reconciliation tasks take the longest? This will help us prioritize what to automate first.

“The booking comes in by mail. Then I print it out, and I put it in... like we had it in my old hotel group, and then we put it in by hand again.” This is the step we will eliminate entirely.

— Peter Edler

One Rate. Everywhere.

A single booking engine that pushes rates out to every channel simultaneously. Set it up before launch and the team will never have to manage spreadsheets for rate distribution.

Set rate in Opera
Channel manager syncs
Booking.com, Expedia update
Availability updates in real time

OTA Distribution

Pushes rates automatically to Booking.com, Expedia, and the OTAs. For tour operators who work by email and spreadsheet, the email agent handles that side.

Real-Time Availability

When availability changes, it updates everywhere instantly. No overbooking risk from stale inventory

Email Agent Handles the Rest

For tour operators who only accept email, the email agent covers those. Between the two systems, every channel is handled.

Channel Manager

Centralization

One place to manage all rates, published everywhere simultaneously. No more individual spreadsheets for each tour operator. No more rate discrepancies between channels. One rate, everywhere, always in sync.

The Vision

One Source of Truth for Every Rate

Rates currently live in multiple places: Opera, spreadsheets, emails, individual tour operator portals. When a rate changes, someone has to manually update it everywhere. The channel manager becomes the single hub that connects every distribution channel and keeps everything in sync.

The end state: Your revenue manager sets a rate once in Opera. Within minutes, that rate is live on Booking.com, Expedia, your direct booking engine, and every connected tour operator portal. Availability updates in real time. No spreadsheets. No phone calls. No “which rate did we send them?”

How It Works

The Distribution Flow

Rate set in Opera
→
Channel manager syncs
→
OTAs update
→
TO portals update
→
Availability updates in real time

Two-Way Synchronization

This is not just a rate push. When a booking comes in from Booking.com, availability is instantly updated across all channels. When Opera’s inventory changes for any reason, every channel reflects it. Overbooking risk drops to near zero.

OTA Distribution

Online Channels, Automated

Booking.com

Rates, availability, and content managed through the channel manager. When you update a room description or add photos in Opera, the channel manager automatically pushes those changes to Booking.com.

Expedia Group

Expedia, Hotels.com, Vrbo. The entire Expedia Group connected through a single integration. Rate parity maintained across all sub-brands without manual intervention.

Additional OTAs can be connected as needed: Agoda, TripAdvisor, Google Hotels, and regional platforms specific to Mauritius tourism
Each channel can have its own rate rules (markup, minimum stay, close-out dates) managed from one interface
Tour Operator Portal Connections

API-Connected Tour Operators

For TOs That Accept API Connections

Larger tour operators (TUI, DER Touristik, FTI, and others) often have booking portals that accept API connections. For these operators, the channel manager pushes rates and availability directly into their systems. No email needed. No manual upload. The rate you set in Opera is the rate they see in their booking system within minutes.

The hybrid approach: Not every tour operator can connect via API. The channel manager handles those who can; the Email Agent (from Phase 1) handles those who can't. Between the two systems, every distribution channel is covered, whether it's a global OTA, an API-connected tour operator, or a small specialist operator who still works by email.

Email Agent for the Rest

No TO Left Behind

Rate updated in Opera
→
Channel manager pushes to APIs
→
Email agent sends to email-only TOs

Complete Coverage

The Mauritius market includes dozens of smaller, specialist TOs who only work via email. No booking portals. No API connections. The Email Agent handles these automatically. When rates change, it sends personalized rate sheets to every email-only operator. Same rate, different delivery method.

Rate Parity Monitoring

The Same Rate, Everywhere

Parity Dashboard

A live view showing the rate for every room type across every channel. If Booking.com is showing €180 but Expedia is showing €175, you will see it immediately. Rate parity violations are flagged in real time, not discovered by a guest who found a cheaper price elsewhere.

Automatic Corrections

When a parity violation is detected, the system can either alert your team or automatically push the correct rate. Configurable per channel. You will want to correct some channels automatically, and review others first.

Rate parity is increasingly monitored by OTAs themselves. Booking.com and Expedia both penalise properties with parity violations through lower search rankings
Direct booking rates can be configured separately, offering a best-price guarantee on the WESS website to encourage direct bookings at a lower commission cost

What we need from the Process Map

To Configure Distribution

Process Map Required

Channel manager configuration depends on understanding how WESS distributes rates and manages availability today. This will come from the process mapping phase.

API vs. email: Which tour operators can connect via API? Which ones only work by email? This determines the split between channel manager and email agent.
Rate structures: How are rates structured? Seasonal tiers (low/mid/high), contract rates per TO, promotional rates, rack rates? Each structure needs to be modeled in the channel manager.
Allotment management: How do allotments work? Which TOs have guaranteed allotments? What are the release periods? How are free-sale and on-request rooms handled?
OTA contracts: What are the current OTA commission structures? What content is managed where? What are the existing rate rules and restrictions?
Approval workflows: Who approves rate changes? Can the revenue manager push rates directly, or does Peter need to sign off on certain changes?

A Digital Front Door That Works

We also run Hexcore Digital, our web and design studio. If we build the site, the same team will own the website and all of the back-end systems. That means no handoff between agencies when we connect the booking engine, Opera, the channel manager, and the dynamic pricing platform. One team, full context, no gaps.

Hotels + Villas + Beach

A clean, modern website covering the full WESS portfolio. Hotels, beach properties, and the villa business. Live before November so there is a proper digital presence from opening day.

Booking Integration

We will connect the site to your booking engine so guests can actually complete a reservation online. Villa listings with availability calendar and enquiry flow. Rates will stay in sync with Opera.

Custom-Built, Premium Feel

Hand-coded in React. Fast load times, smooth animations, and a luxury feel that matches the properties. Not a template. CMS behind it so your team can update imagery, rates, and offers without a developer.

“At the end of the day, they still call you. Then I don’t need a web page, call me direct.” That is exactly the problem. Guests call because the website cannot actually complete a booking.

— Peter Edler

Website & Direct

Booking Engine

A premium digital front door for the entire WESS portfolio. Hotels, villas, and beach properties. Guests can browse, book, and pay online. Your team manages content without developers. Connected to the channel manager so rates and availability are always live.

Why this matters

Guests Call Because the Website Can’t Convert

The revenue leak: When a guest visits the WESS website and can't complete a booking, they either call the hotel (costing staff time) or book through an OTA (costing you commission). A direct booking engine eliminates both. The guest books on your site, at your rate, with zero commission.

OTA commissions typically run at **15–25%** of the booking value. Every booking you shift from Booking.com to your own website is pure margin recovery.
Hotels with effective direct booking engines typically convert **3–5%** of website visitors. Without a booking engine, the conversion rate is effectively **zero**. Every interested visitor becomes a phone call or an OTA booking.
The three local companies quoting for the website won't integrate with your channel manager or Opera. We will, because we are building both systems.

What We Build

The Full WESS Portfolio Online

Hotels

Each hotel property gets its own section with room types, gallery, amenities, dining options, and location details. All connected to the booking engine for instant reservations.

Villas

Individual villa listings with detailed floor plans, photo galleries, capacity information, and pricing. The villa business is growing faster than hotels. It deserves a proper digital presence.

Beach Properties

Beach-facing properties showcased with immersive imagery and the booking tools to convert browsers into guests. Each property's unique character comes through in the design.

You can already get a taste of what this looks like in our demo. The "Where Paradise Feels Like Home" concept hero in the main proposal is a working demo of the design direction. Premium typography, cinematic imagery, the WESS brand elevated to match the quality of the properties themselves.

Direct Booking Engine

Book and Pay Online

Guest selects dates
→
Live availability shown

→
Rate displayed
→
Guest books & pays
→
Confirmation sent

Hotel Booking Flow

Select the property, choose the dates, see available room types with live rates, add supplements (meal plans, transfers, experiences), enter details, pay securely. Confirmation email sent instantly. Booking appears in Opera within minutes.

Villa Booking Flow

Villa availability calendar shows open dates at a glance. Guests can book directly for available periods or submit an enquiry for custom dates. Villa-specific details (bedrooms, staff, pool, proximity to beach, etc.) all clearly presented.

Secure payments PCI-compliant payment processing. Credit card, bank transfer, or deposit options configurable per property and per booking type.
Multi-currency Guests see prices in their local currency, EUR, GBP, USD, ZAR, etc. Configured per market. Exchange rates update automatically.
Best price guarantee Show a ‘book direct for the best rate’ message, backed by the channel manager ensuring the direct rate is always equal or better than OTA rates.

Channel Manager Integration

Rates and Availability Always Live

Seamless Connection

Because the same team builds the website and the channel manager, the integration is native. When a rate changes in Opera, the website updates. When a booking comes through the website, availability adjusts across all channels instantly.

No stale rates. The price a guest sees on the website is always the current price in Opera
No overbooking. When a room is booked on the website, it's immediately unavailable on Booking.com, Expedia, and every other channel
Promotions sync automatically. Create a flash sale in Opera, and it appears on the website within minutes

Custom Coded

Your Team Manages Content

No Developer Dependency

Hand-coded in React with a headless CMS behind it. Your marketing team updates images, text, offers, and pages through a simple editor. New villa listing? 20 minutes. Seasonal promotion banner? Change it yourself. No developer needed.

Premium Design Freedom

Not a template. A bespoke site designed and coded from scratch to match the WESS brand. Smooth animations, luxury feel, fast performance. The CMS lets your team update content within that design. The structure remains premium. The content stays fresh.

The Villa Opportunity

Growing Faster Than Hotels

A Business That Deserves Its Own Digital Presence

The villa business is growing faster than hotels. Villa guests spend more time researching their trips, spend more, and frequently enquire beforehand rather than book instantly. They need detailed property pages with floor plans, photo tours, and availability calendars. The new website gives villas the prominence they deserve and the tools to convert interest into bookings.

Individual villa pages with full photo galleries, amenity lists, and floor plans
Availability calendar showing open dates at a glance, reducing enquiry volume for already-booked periods
Enquiry flow for custom requests (multi-villa bookings, events, extended stays) that routes to the right team member

We Made You a Demo Homepage

A working concept of how the WESS website could be designed. Have a look.

Smart Pricing When It Matters

Most of your business derives from tour operator contracts with fixed seasonal rates. Dynamic pricing does not apply there. It applies to OTA and direct bookings, where rates can flex in real time.

OTA & Direct Bookings

Monitors occupancy, competitor rates, and demand signals in real time. Automatically adjusts rates on Booking.com, Expedia, and the website.

Seasonal Contract Management

Low/mid/high season rates for tour operator contracts managed in one place. As the direct booking share grows over time, the dynamic engine becomes more valuable.

“Dynamic pricing will be the next step.” We position this as the infrastructure that's ready when the market catches up. And it is coming.

— Peter Edler

Dynamic Pricing

Smart, automated rate adjustments for OTA and direct bookings based on occupancy, demand signals, and competitor rates. Not for tour operator contracts. Positioned as forward-looking infrastructure that becomes more valuable as direct booking share grows.

Where It Applies

Not Everything. The Right Things.

Important context: Most WESS business comes from tour operator contracts with fixed seasonal rates. Dynamic pricing does not apply to those. Those rates are agreed annually and do not change with daily demand. Dynamic pricing applies to OTA and direct booking channels, where rates can flex in real time.

Dynamic Pricing Applies

Booking.com, Expedia, direct website bookings, walk-in rates, last-minute availability. These channels benefit from real-time rate adjustments based on demand.

Fixed Seasonal Rates

Tour operator contracts, group bookings, allotment blocks. These stay at the agreed seasonal rates. The system manages them centrally but doesn’t dynamically adjust them.

Today, the OTA/direct share may be relatively small but it’s growing. And as it grows, the revenue impact of dynamic pricing compounds.

Even with a small OTA share, dynamic pricing can capture significant incremental revenue during high-demand periods when the hotel would have sold the room anyway, just at a lower price.

How It Works

The Pricing Engine

Monitor occupancy
→
Check competitor rates
→
Analyze demand signals
→
Calculate optimal rate
→
Push to OTAs & website

Occupancy-Based Adjustments

As a property fills up, rates increase automatically. At 50% occupancy, the rate might be at the base level. At 80%, it rises. At 95%, it's at a premium. The curve is configurable. You control how aggressive the pricing gets.

Competitor Rate Monitoring

The engine monitors competitor hotel rates on OTAs in real time. If competitor properties are selling out and raising rates, your rates adjust accordingly. If the market is soft, the engine can hold or lower rates to maintain competitiveness.

Demand Signal Analysis

Beyond occupancy and competitors, the engine factors in search volume, flight booking trends to Mauritius, local events, public holidays in source markets, and historical patterns.

Rate Guardrails

You set the floor and ceiling. The engine never prices below your minimum or above your maximum. Weekend rates, holiday rates, and blackout dates are all configurable. The engine executes the strategy. It does not replace it.

Seasonal Contract Management

TO Contracts, Managed Centrally

One Place for All Rate Tiers

While dynamic pricing handles the OTA/direct channels, the same system manages the fixed seasonal rates for tour operator contracts. Low-season, mid-season, high-season, all defined centrally, assigned per tour operator, and distributed through the channel manager and email agent. One system, two pricing models, zero confusion.

Season definitions Define exactly which dates fall into low-, mid-, and high-season. The system automatically applies the correct rate based on stay dates.
Contract-specific rates Each TO can have their own contracted rates per season. The system tracks which operator has which rate and ensures the correct price is quoted every time.
Year-on-year comparison Compare contracted rates across years. See at a glance whether you're giving TUI a better or worse rate than last year, and by how much.

Future Value

Infrastructure That Grows with You

The strategic position: Dynamic pricing is forward-looking infrastructure. Today, most WESS revenue comes from TO contracts with fixed rates. But the direct channel is growing, and every point shifted from TO to direct means higher margins and more pricing flexibility. The engine is ready when the market catches up.

Year 1: Dynamic pricing on OTA/direct channels. Even a small share benefits from demand-based pricing. The foundation is laid.
Year 2–3: As the website and direct booking engine drive more direct traffic, the dynamic engine has more inventory to optimize. Revenue impact grows proportionally.
Long-term: Revenue intelligence layer on top: demand forecasting, market segment analysis, pickup pace tracking. The data accumulated by the pricing engine becomes an asset for strategic pricing decisions across all channels, including TO negotiations.

One View. The Whole Group.

You are building a centralized head office that will operate with one view of the entire business from day one. Not something you retrofit after a year of doing it manually.

Live Occupancy

Real-time occupancy across all properties, bookings by channel, revenue by outlet, all at a glance

Rate Parity & Comms

Rate parity status across all channels, outstanding tour operator communications, all on one dashboard

Morning Briefing

Peter gets a daily briefing at 9AM. We build a proper version of this for the whole group as a web app with live graphs and real-time data. Automated, comprehensive, and ready from day one.

“9 o'clock in the morning... PETER, today…” Imagine that, but for every property, every department, every number that matters. A dedicated web app with live dashboards, graphs, and alerts. Accessible from any device.

— Peter Edler

Central Operations

Dashboard

One unified view of the entire WESS group. Live occupancy, revenue by channel, rate parity status, outstanding communications. All in one place. The product that makes a centralized head office possible.

Peter’s Vision

Centralized Head Office. One View.

The goal: Peter is building a centralized head office. The objective is to maintain one unified view of the business. Not five different logins. Not waiting for property managers to email reports. Not piecing together fragmented data. One screen, every number that matters, updated in real time.

From Fragmentation to Clarity

Today, understanding the business means checking Opera for occupancy, Sage for financials, email for TO communications, and spreadsheets for the rest. The dashboard pulls all of it into one live view.

What It Shows

Everything That Matters

Live Occupancy

Real-time occupancy across all WESS properties. Today’s occupancy, this week’s forecast, next month’s projection. Color-coded by performance against target. At a glance, you know which properties need attention.

Bookings by Channel

How many bookings came through Booking.com vs. Expedia vs. direct vs. tour operators this week? This month? This quarter? See channel mix shifting in real time and spot trends early.

Rate Parity Status

Are your rates the same across all channels right now? The dashboard shows parity status at a glance. Green for matched, red for violations. Click through to see which channel is off and by how much.

TO Communications

Outstanding tour operator emails awaiting response. How many are in the queue? How long has the oldest been waiting? Which require human review? The email agent's status at a glance.

Revenue by Outlet

How is each restaurant, bar, spa, and room division performing? Daily revenue by outlet, compared to budget and last year. F&B performance at a glance across the entire portfolio.

Morning Briefing Automation

9am. Your Day, Automated.

Peter’s Notion, but for the Entire Group

Peter already has a Notion setup that tells him his day at 9AM. We will build a proper version for the entire WESS operation. At 9AM, the dashboard will compile an automated briefing: yesterday’s occupancy and revenue, today’s arrivals and VIPs, outstanding items, and TO emails needing review. Delivered to Notion, email, or the dashboard itself.

Data collected overnight
→

Briefing compiled at 9AM
→
Delivered to Notion / email
→
Action items highlighted
Yesterday's performance Occupancy, revenue, and ADR for each property. How did yesterday compare to the forecast? To last year?
Today's operations Arrivals, departures, VIPs, special requests. Which properties are at capacity? Which have last-minute availability?
Action items Tour operator emails needing human review. Rate parity violations. Anything that needs Peter's attention is highlighted automatically.
Week ahead Occupancy forecast for the next seven days. Upcoming group arrivals. Scheduled maintenance. Anything that affects operations.

Platform Options

Notion or Standalone

Option A: Built into Notion

Peter already utilizes Notion. We will build the dashboard and morning briefing directly within his existing workspace using Notion databases, automated pages, and API integrations. Zero new tools to learn. Data flows into where he already works.

Option B: Standalone Web App

Purpose-built dashboard accessible from any browser. Live charts, interactive maps, drill-down analytics. Shareable with the wider team without Notion access. Can still push the morning briefing to Notion.

Our recommendation: Start with Notion integration for the morning briefing (fast to deliver, already in use) and build the standalone dashboard in parallel. Both coexist: Notion for Peter's daily workflow, standalone for the operations team and GMs.

What We Need from the Process Map

To Build the Right Dashboard

Process Map Required

A dashboard is only as good as the data it shows. We need to understand what Peter and the team must see to run the enterprise.

What KPIs matter? Occupancy, ADR, RevPAR, GOP. Which metrics does Peter look at first? What does the board report require? What do the GMs need?
What data sources exist? Opera, Sage, Symphony POS, the channel manager. Which systems hold the data? How is it currently accessed?
What decisions are made from this data? Understanding what actions follow from the numbers helps us prioritize what's on the dashboard vs. what's in a drill-down report.
Who else needs access? Is this Peter- only? Does each GM need a property-specific view? Does the finance team need their own slice? The access model determines the architecture.
Peter's current Notion setup What does the existing Notion morning briefing look like? What does he like about it? What's missing? We will build on what works.

What Else We Can Do

Each of these came from our recent conversation. They can be added on once the foundation is in place, or tackled standalone if the priority is there.

Guest App & Digital Concierge

Custom-built concierge app connected to your hotel systems and outside services. Room service, spa, transfers, itineraries, local experiences, all from the guest's phone. Works across all properties.

WhatsApp Guest Messaging

Mauritius is a WhatsApp-heavy market. Automated pre-arrival messages, in-stay requests, and post-stay feedback, all through the channel guests already use. Integrates with Opera for context in every message.

Staff Training & SOPs

Digital SOP platform for every department. Standardized procedures, onboarding checklists, and video guides. Accessible from any device, updated centrally.

Revenue Intelligence

Beyond dynamic pricing: competitor rate monitoring, demand forecasting, pickup pace tracking, and market segment analysis. The data WESS needs to make smarter pricing decisions, even for tour operator contracts.

F&B QR Ordering

QR-based digital ordering from the start. Guests scan, browse, order, it hits the Symphony POS directly. No printed menus to maintain. The team learns one way of doing things and it is the modern one.

“The question is how far we want to go and what does it cost on the other side.” Every module above is independent. Pick what matters most, leave the rest for later. No all-or-nothing.

— Peter Edler

How We Get There

Phased Approach

We are not proposing everything at once. Clear starting point, full vision, and you pick what matters most.

Track A, Start Immediately

No process map needed

Tour Operator Email Agent, connect to inbox, start automating
Website, hotels, villas, beach, connected to your booking engine
Guest App, room service, spa, dining, experiences
WhatsApp Messaging, pre-arrival, in-stay, post-stay
F&B QR Ordering, scan, order, hits Symphony POS
Staff Training Platform, SOPs, onboarding, video guides

Track B, After Process Map

Needs your specific workflows

These integrate deeply into your operations. We will need to know exactly how data flows before we wire them up.

Opera-to-Sage Connector, depends on the chart of accounts, posting logic, night audit
Central Dashboard, depends on what KPIs matter and where the data lives
Dynamic Pricing, depends on contract rules, seasonal structures
CRM and Loyalty, depends on guest journey across properties
Marriott Compliance, depends on brand standard requirements

Both tracks can run in parallel.

We can build the email agent, website, and guest tools while mapping the workflows needed for the deeper integrations. No waiting around.

Step Zero

Remote Discovery

A video call to understand how the operation will run: how tour operators reach you, where rates live, what systems need connecting.

Immediately After

Track A, Email Agent, Website, Guest Tools

We start building what needs to be ready for November. The email agent, the website, the guest-facing tools. All in place before the team arrives.

In Parallel

Deeper Discovery, Workflow Mapping

While Track A is underway, we go deeper: structured sessions with each department to document the specific data flows needed for Opera → Sage and the wider integrations.

Discovery Complete

Track B, Integrations & Infrastructure

Now we know how Opera and Sage need to connect. We build the connectors, the dashboard, the pricing engine. All scoped to how WESS actually operates.

Ongoing

Expand, Optimize, Add Modules

Dynamic pricing, CRM, revenue intelligence, villa platform. Each one is a module that plugs in when the time is right. ‘Nothing is all-or-nothing’.

Infrastructure

Working Within Your Constraints

Marriott has on-premise requirements and brand standards. As everything is being set up from scratch, we can build with those constraints in mind from the beginning rather than working around them later.

Sits Alongside Marriott

Our tools run independently of your Marriott infrastructure. They connect to Opera through its standard interfaces, in the same way any approved third-party system would. Nothing we build will require changes to your Marriott setup.

Cloud-Native, Hybrid-Ready

Everything we build is cloud-hosted. Your on-premise to cloud transition is still underway for the Marriott properties. Our systems work regardless of where your data sits. When the full cloud migration happens, nothing needs rebuilding.

We need to understand your Marriott obligations during discovery. Some things we can do freely, others will need to work around brand requirements. Better to map that out properly than guess.

Support & Reliability

Friday Problems

Get Friday Answers

You told us this matters more than anything else. We agree. The best system is worthless if nobody picks up the phone when it breaks.

European Hosting

All our systems are hosted in Europe. Proper data centers with redundancy, backups and failover. Not a server in someone's office with no maintenance window.

Responsive Support

When something goes wrong, you get a person who knows your setup. Not a ticket queue. Not a chatbot. We will agree on response times as part of the engagement and will stick to them.

Proactive Monitoring

We monitor what we build. If something breaks, we want to know before you do. Automated alerts, health checks, and regular performance reviews.

"If something breaks Friday... maybe I get an answer on Monday." That is exactly the situation we are here to replace. Our support does not work like that.

— Peter Edler
How We Work

A Partner,

Not a Vendor

We are not here to deliver software and disappear. You are building something long-term. So are we.

We integrate your systems.
Opera, Sage, email, all being set up at the same time, wired together properly from the start.
We build the automation layer.
The email agent, the data flows, the reporting. The layer that sits on top of your tools and makes them talk to each other.
We help shape what comes next.
The head office structure, the centralization, the shift towards direct bookings. We do not just implement. We help design how the operation should work.
We work in the real world.
Tour operators who only use email. Marriott brand standards. A team arriving fresh that needs to learn best practices from day one. We build for the situation you are walking into.
Investment

What This Costs

All figures in EUR. Final scope and pricing confirmed after the discovery.

Starting Point
Process Discovery
€7,000
one-off
Interviews with key staff across each department. We map how bookings, rates, and finance will work. Delivered as process maps and a prioritised roadmap.
Ready Before November

Tour Operator Email Agent
€22,000
€800 /month
Custom-built AI that monitors your inbox, classifies tour operator emails, pulls the correct rate from Opera, and drafts responses automatically. Rate version tracking and discrepancy detection included.
More info →

Tour Operator

Email Agent

An AI system that monitors your hotel inbox around the clock. It reads tour operator emails, classifies intent, pulls the correct data, and drafts responses. Your team reviews and sends, or the system sends autonomously once trust has been established.

How It Works

Step-by-Step

Every email that arrives is processed through a structured pipeline. The agent classifies, retrieves, and drafts with full traceability.

Email arrives in inbox
→
AI classifies intent
→
Pulls correct data
→
Drafts response
→
Sends or queues for review

Intent Classification

The AI reads the incoming email and classifies it: booking request, rate query, contract update, availability check, special offer, or general enquiry. Each category triggers a different processing path.

Data Retrieval

Based on intent, the agent pulls the relevant data: rates from Opera, availability from the channel manager, contract terms from the rate sheet database. Every figure comes from a verified source.

Response Drafting

The agent composes a response using the correct data, matching the tone and format your team already uses. Rate sheets, contracts, and confirmations are generated and attached automatically.

Human-in-the-Loop

Every draft starts in a review queue. Over time, routine responses (availability confirmations, standard rate replies) can be set to auto-send. Complex negotiations always stay in the queue.

What It Handles

Every TO Communication, Covered

Rate Requests Tour operator asks for current rates for a specific period. The agent pulls the correct seasonal rate from Opera and responds with the formatted rate sheet.
Booking Confirmations Reservation request comes in. The agent checks availability, confirms the booking in Opera, and sends the confirmation back to the TO with all relevant details.
Contract Negotiations When a TO proposes rate amendments or new terms, the agent flags it for human review with full context: current contract terms, proposed changes, historical rates with that operator.
Special Offer Distribution When you create a new promotion or early bird offer, the agent sends it to your entire TO list, personalized per operator, with the correct rates for their market segment.
Availability Queries ‘Do you have 3 Superior rooms 15–22 December?’ The agent checks Opera in real time and responds within minutes, not hours.

Version Tracking & Audit Trail

Who Has What Rates

Knowing which tour operator has which version of your rates is one of the biggest operational headaches. The email agent solves it.

Rate Version Registry

Every rate sheet sent is logged: which version, when, who opened it. You always know which operator has which prices.

Outdated Rate Alerts

When you update rates, the system flags every tour operator still working off the old version. It can automatically send update notifications, or queue them for your team to review first.

Why this matters: Right now, if you update your rates in November for the upcoming high season, there’s no easy way to know which of your 50+ tour operators received the new rates and which are still quoting the old ones. The agent tracks every version, every send, every acknowledgement.

Discrepancy Detection

Catch Mismatches Before They Cost You

TO sends booking at price X
→
Agent checks Opera rate
→
Mismatch detected
→
Alert raised before guest arrives

The “Ping Pong” Problem, Solved

A tour operator books a room at a rate that doesn’t match Opera. Today, this gets discovered at check-in or during month-end reconciliation. The email agent cross-checks every incoming booking against the contracted rate and flags discrepancies immediately. Resolution happens in the email chain, not at the front desk.

Catches wrong room category pricing (e.g., TO charged Standard rate for a Superior room)
Detects outdated seasonal rates being applied (e.g., low season price used during high season dates)
Flags supplement discrepancies (meal plans, transfers, special requests billed incorrectly)
How It Learns

Gets Smarter Over Time

Starts with Templates

We load your existing email templates, rate sheet formats, and standard responses. From day one, the agent matches your team’s style and language.

Learns from Edits

Every time your team edits a draft before sending, the agent learns from the correction. If Sarah adds a specific line for German tour operators, or Peter prefers a different closing for long-standing partners, the agent picks up on these patterns.

Continuous Improvement

Over time, the queue shrinks. Routine responses that pass review without edits get promoted to auto-send. Complex cases stay in the queue. Faster without being reckless.

What We Need from the Process Map

To Build This Right

Process Map Required

To build the email agent properly, we need to understand the exact email flow. This comes from your team during the process mapping phase.

Which mailboxes? How many inboxes handle TO communications? Is it per property, per person, or centralized?
Who handles what? Which team members handle which types of email? Are there specialists for specific markets or operators?
What systems provide the data? Where do current rates live? Opera? Excel? A combination thereof? Which is the source of truth?
What's the approval flow? Which responses need manager approval? Which can the team send directly? What are the escalation rules?
What templates already exist? Current email templates, rate sheet formats, contract templates. These become the agent's starting knowledge.

Website
€8,000 – €18,000
€100 /month
Custom-coded site. Cinematic animations, premium luxury feel, fast performance. Connected to your booking engine. Final price depends on complexity, number of standalone sites, and CMS requirements.
More info →

Website & Direct Booking Engine

A premium digital front door for the entire WESS portfolio. Hotels, villas, and beach properties. Guests can browse, book, and pay online. Your team manages content without developers. Connected to the channel manager so rates and availability are always live.

Why This Matters

Guests Call Because the Website Can't Convert

The revenue leak: When a guest visits the WESS website and cannot complete a booking, they either call the hotel (costing staff time) or book through an OTA (costing you commission). A direct booking engine eliminates both. The guest books on your site, at your rate, with zero commission.

OTA commissions typically run at **15–25%** of the booking value. Every booking you shift from Booking.com to your own website is pure margin recovery.
Hotels with effective direct booking engines typically convert **3–5%** of website visitors. Without a booking engine, the conversion rate is effectively **zero**. Every interested visitor becomes a phone call or an OTA booking.
The three local companies quoting for the website won't integrate with your channel manager or Opera. We will, because we are building both systems.
What We Build

The Full WESS Portfolio Online

Hotels

Each hotel property gets its own section with room types, gallery, amenities, dining options, and location details. All connected to the booking engine for instant reservations.

Villas

Individual villa listings with detailed floor plans, photo galleries, capacity information, and pricing. The villa business is growing faster than hotels. It deserves a proper digital presence.

Beach Properties

Beach-facing properties showcased with immersive imagery and the booking tools to convert browsers into guests. Each property's unique character comes through in the design.

You can already get a taste of what this will look like in the demo. The "Where Paradise Feels Like Home" concept hero in the main proposal is a working demo of the design direction. Premium typography, cinematic imagery, the WESS brand elevated to match the quality of the properties themselves.

Direct Booking Engine

Book and Pay Online

Guest selects dates
→
Live availability shown
→
Rate displayed
→
Guest books & pays
→
Confirmation sent

Hotel Booking Flow

Select property, choose dates, see available room types with live rates, add supplements (meal plans, transfers, experiences), enter details, pay securely. Confirmation email sent instantly. Booking appears in Opera within minutes.

Villa Booking Flow

Villa availability calendar shows open dates at a glance. Guests can book directly for available periods or submit an enquiry for custom dates. Villa-specific details (bedrooms, staff, pool, proximity to beach) all clearly presented.

Secure payments PCI-compliant payment processing. Credit card, bank transfer, or deposit options configurable per property and per booking type.
Multi-currency Guests see prices in their local currency, EUR, GBP, USD, ZAR, etc. Configured per market. Exchange rates update automatically.
Best price guarantee Show a ‘book direct for the best rate’ message, backed by the channel manager ensuring the direct rate is always equal to or better than OTA rates.

Channel Manager Integration

Rates and Availability Always Live

Seamless Connection

Because the same team builds the website and the channel manager, the integration is native. When a rate changes in Opera, the website updates. When a booking comes through the website, availability adjusts across all channels instantly.

No stale rates. The price a guest sees on the website is always the current price in Opera
No overbooking. When a room is booked on the website, it’s immediately unavailable on Booking.com, Expedia, and every other channel
Promotions sync automatically. Create a flash sale in Opera, and it appears on the website within minutes

Custom Coded

Your Team Manages Content

No Developer Dependency

Hand-coded in React with a headless CMS behind it. Your marketing team updates images, text, offers, and pages through a simple editor. New villa listing? 20 minutes. Seasonal promotion banner? Change it yourself. No developer needed.

Premium Design Freedom

Not a template but a bespoke site designed and coded from scratch to match the WESS brand. Smooth animations, luxury feel, fast performance. The CMS lets your team update content within that design. The structure stays premium. The content stays fresh.

The Villa Opportunity

Growing Faster Than Hotels

A Business That Deserves Its Own Digital Presence

The villa business is growing faster than hotels. Villa guests research longer, spend more, and enquire more often rather than book instantly. They need detailed property pages with floor plans, photo tours, and availability calendars. The new website gives villas the prominence they deserve and the tools to convert interest into bookings.

Individual villa pages with full photo galleries, amenity lists, and floor plans
Availability calendar showing open dates at a glance, reducing enquiry volume for already-booked periods
Enquiry flow for custom requests (multi-villa bookings, events, extended stays) that routes to the right team member

Guest App / Concierge
€12,000
€150 /property
Custom-built concierge app that connects to your hotel systems and outside services. Room service, spa, restaurants, transfers, itineraries, local experiences, all from the guest's phone. Branded for WESS.

WhatsApp Guest Messaging
€5,000
€150 /property
Custom-built. Pre-arrival messaging, in-stay requests, post-stay feedback, all automated and triggered from Opera reservations. Fully customized to how WESS communicates with guests.
QR Code F&B Ordering
€3,500
€80 /outlet
Custom digital menus with QR ordering connected to Symphony POS. Guests scan, browse, order. No printed menus. Each outlet gets its own menu, pricing, and POS mapping.

After the Discovery
Opera-to-Sage Integration
€15,000
€500 /month
Custom-built connector between your PMS and accounting software. Bookings flow automatically into Sage with correct account codes, tax, and department mapping. Rate reconciliation runs continuously.
More info →

Opera-to-Sage Integration

Eliminates manual data entry between your PMS and accounting software. Bookings flow from Opera to Sage automatically. No printing, no retyping, no errors.

The Problem Today

Where the Errors Start

The current workflow: A booking arrives by email. Someone prints it. Someone else enters it into Sage by hand. Every step is an opportunity for errors: wrong room, wrong date, wrong rate, wrong name. These compound through month-end, and finance spends days reconciling.

Booking email arrives
→
Printed out
→
Entered into Sage manually
→
Errors accumulate
Multi-property groups typically spend **$15,000–30,000/month** on manual PMS-to-accounting reconciliation
Manual entry error rates in hospitality accounting typically run at **2–5%** of all transactions. Each error takes 15–30 minutes to resolve
Month-end close for multi-property groups without automation averages **5–7 working days**. With automation, it drops to 1–2 days
How the Connector Works

The Automated Pipeline

Booking confirmed in Opera
→

Connector reads booking data
→
Maps to Sage chart of accounts
→
Creates invoice automatically
→
Reconciliation runs

Data Extraction

The connector monitors Opera for confirmed bookings and extracts the full dataset: guest details, room type, rate code, dates, supplements, meal plans, and billing instructions.

Account Mapping

Each Opera field maps to the correct Sage account code. Room revenue goes to the right category. Meal plans split correctly. Taxes are calculated automatically. Configured once during setup, maintained centrally.

Invoice Generation

Sage invoices are created automatically with correct line items, dates, and amounts. No human touches the data between Opera and Sage. Ready for review, not retyping.

Continuous Reconciliation

The connector continuously reconciles. If a rate changes in Opera after the invoice was created, the system flags it. If a booking is modified or canceled, Sage updates automatically.

What Gets Automated

End-to-End, Hands-Free

Invoice Creation Every confirmed booking generates a corresponding Sage invoice with correct account codes, amounts, and dates. No manual entry.
Rate Reconciliation The connector cross-checks the rate the tour operator invoiced against the rate in Opera. Mismatches are flagged before they hit the finance department.
Payment Matching When payments arrive, the system matches them against outstanding invoices. Partial payments, overpayments, and short-pays are all tracked and flagged.
Night Audit Posting End-of-day postings from Opera flow into Sage automatically. Room revenue, F&B charges, sundries. Everything posts to the correct account without manual intervention.

Multi-Property Consolidation Data from all WESS properties flows into a single Sage instance, giving the head office a consolidated financial view without waiting for individual property reports.

Error Prevention

Catches Problems Before Finance

Category Mismatch Detection

If a booking comes in as “Superior Sea View” but the rate code maps to “Standard Garden,” the connector flags it. These mismatches are the ones that cause the most painful reconciliation issues at month-end.

Date Validation

Check-in and check-out dates in the booking are validated against the invoice period. Catches the common error where a booking spans two billing periods but is invoiced to only one.

Rate Discrepancy Alerts

When the tour operator’s price doesn't match Opera’s contracted rate for that operator, the system raises an alert immediately, not at month-end. Resolution happens in real time.

Duplicate Prevention

Every transaction is tracked by a unique ID. If the same booking is processed twice, the system catches it before a duplicate invoice is created in Sage.

What We Need from the Process Map

This Needs Your Accounting Workflow

Process Map Required

We cannot build this without understanding the specific accounting workflow at WESS. We need to see how data moves from Opera to Sage today before we automate it.

Which Sage version? Sage 50, Sage 200, Sage X3? The connector architecture depends on the specific version and its API capabilities.
Chart of accounts structure How is the chart of accounts organised? By property, by department, by revenue type? The mapping layer needs to match your existing structure.

Night audit process What happens at end-of-day? What reports are generated? What data gets posted where? This determines the nightly sync logic.
Multi-property handling How are the different WESS properties represented in Sage? Separate companies? Departments within one company? Cost centers?
Current pain points Where specifically do errors happen most? Which reconciliation tasks take the longest? This helps us prioritize what to automate first.

Central Dashboard
€8,000
€300 /month
Custom built operations dashboard. Live occupancy, bookings by channel, rate parity, revenue by outlet. Morning briefing automation. Data pulled from every connected system.
More info →

Central Operations Dashboard

One unified view of the entire WESS group. Live occupancy, revenue by channel, rate parity status, outstanding communications. All in one place. The product that makes a centralised head office possible.

Peter's Vision

Centralized Head Office. One View.

The goal: Peter is building a centralized head office. The objective is one unified view of the business. Not five different logins. Not waiting for property managers to email reports. Not piecing together fragmented data. One screen, every number that matters, updated in real time.

From Fragmentation to Clarity

Today, understanding the business means checking Opera for occupancy, Sage for financials, email for TO communications, and spreadsheets for the rest. The dashboard pulls all of it into one live view.

What It Shows

Everything That Matters

Live Occupancy

Real-time occupancy across all WESS properties. Today's occupancy, this week's forecast, next month's projection. Colour-coded by performance against target. At a glance, you know which properties need attention.

Bookings by Channel

How many bookings came through Booking.com vs. Expedia vs. direct vs. tour operators this week? This month? This quarter? See channel mix shifting in real time and spot trends early.

Rate Parity Status

Are your rates the same across all channels right now? The dashboard shows parity status at a glance. Green for matched, red for violations. Click through to see which channel is off and by how much.

TO Communications

Outstanding tour operator emails awaiting response. How many are in the queue? How long has the oldest been waiting? Which need a human review? The email agent's status at a glance.

Revenue by Outlet

How is each restaurant, bar, spa, and rooms division performing? Daily revenue by outlet, compared to budget and previous year. F&B performance at a glance across the entire portfolio.

Morning Briefing Automation

9AM. Your Day, Automated.

Peter's Notion, but for the Entire Group

Peter already has a Notion setup that tells him his day at 9AM. We will build a proper version for the entire WESS operation. At 9AM, the dashboard compiles an automated briefing: yesterday's occupancy and revenue, today's arrivals and VIPs, outstanding items, and TO emails needing review. Delivered to Notion, email, or the dashboard itself.

Data collected overnight
→
Briefing compiled at 9AM
→
Delivered to Notion / email
→
Action items highlighted

Yesterday's performance Occupancy, revenue, and ADR for each property. How did yesterday compare to the forecast? To last year?
Today's operations Arrivals, departures, VIPs, special requests. Which properties are at capacity? Which have last-minute availability?
Action items Tour operator emails needing human review. Rate parity violations. Anything that needs Peter's attention, highlighted automatically.
Week ahead Occupancy forecast for the next seven days. Upcoming group arrivals. Scheduled maintenance. Anything that affects operations.
Platform Options

Notion or Standalone

Option A: Built into Notion

Peter already utilizes Notion. We will build the dashboard and morning briefing directly within his existing workspace using Notion databases, automated pages, and API integrations. Zero new tools to learn. Data flows into where he already works.

Option B: Standalone Web App

Purpose-built dashboard accessible from any browser. Live charts, interactive maps, drill-down analytics. Shareable with the wider team without Notion access. Can still push the morning briefing to Notion.

Our recommendation: Start with Notion integration for the morning briefing (fast to deliver, already in use) and build the standalone dashboard in parallel. Both coexist: Notion for Peter's daily workflow, standalone for the operations team and GMs.

What We Need from the Process Map

To Build the Right Dashboard

Process Map Required

A dashboard is only as good as the data it shows. We need to understand what Peter and the team must see to run the business.

What KPIs matter? Occupancy, ADR, RevPAR, GOP. Which metrics does Peter look at first? What does the board report require? What do the GMs need?
What data sources exist? Opera, Sage, Symphony POS, the channel manager. Which systems hold the data? How is it currently accessed?
What decisions are made based on this data? Understanding what actions follow from the numbers helps us prioritize what's on the dashboard vs. what's a drill-down report.

Who else needs access? Is this Peter-only? Does each GM need a property-specific view? Does the finance team need their own slice? The access model determines the architecture. **Peter's current Notion setup** What does the existing Notion morning briefing look like? What does he like about it? What's missing? We build on what works.

Dynamic Pricing
€15,000
€250 /property
Automated rate adjustments for OTA and direct channels based on occupancy, competitor rates, and demand signals. Custom-built pricing engine with Opera integration, rate strategy configuration, and ongoing optimization.
More info →

Dynamic Pricing

Smart, automated rate adjustments for OTA and direct bookings based on occupancy, demand signals, and competitor rates. Not for tour operator contracts. Positioned as forward-looking infrastructure that becomes more valuable as direct booking share grows.

Where It Applies

Not Everything. The Right Things.

Important context: Most WESS business comes from tour operator contracts with fixed seasonal rates. Dynamic pricing does not apply to those. Those rates are agreed annually and do not change with daily demand. Dynamic pricing applies to OTA and direct booking channels, where rates can flex in real time.

Dynamic Pricing Applies

Booking.com, Expedia, direct website bookings, walk-in rates, last-minute availability. These channels benefit from real-time rate adjustments based on demand.

Fixed Seasonal Rates

Tour operator contracts, group bookings, allotment blocks. These stay at the agreed seasonal rates. The system manages them centrally but doesn't dynamically adjust them.

Today, the OTA/direct share may be relatively small. But it's growing. And as it grows, the revenue impact of dynamic pricing compounds.

Even with a small OTA share, dynamic pricing can capture significant incremental revenue during high-demand periods when the hotel would have sold the room anyway, just at a lower price.
How It Works

The Pricing Engine

Monitor occupancy
→
Check competitor rates
→
Analyze demand signals
→
Calculate optimal rate
→
Push to OTAs & website

Occupancy-Based Adjustments

As a property fills up, rates increase automatically. At 50% occupancy, the rate might be at the base level. At 80%, it rises. At 95%, it's at a premium. The curve is configurable. You control how aggressive the pricing gets.

Competitor Rate Monitoring

The engine monitors competitor hotel rates on OTAs in real time. If competitor properties are selling out and raising rates, your rates can adjust accordingly. If the market is soft, the engine can hold or lower rates to maintain competitiveness.

Demand Signal Analysis

Beyond occupancy and competitors, the engine factors in search volume, flight booking trends to Mauritius, local events, public holidays in source markets, and historical patterns.

Rate Guardrails

You set the floor and ceiling. The engine never prices below your minimum or above your maximum. Weekend rates, holiday rates, and blackout dates are all configurable. The engine executes the strategy. It does not replace it.

Seasonal Contract Management

TO Contracts, Managed Centrally

One Place for All Rate Tiers

While dynamic pricing handles the OTA/direct channels, the same system manages the fixed seasonal rates for tour operator contracts. Low-season, mid-season, high-season, all defined centrally, assigned per tour operator, and distributed through the channel manager and email agent. One system, two pricing models, zero confusion.

Season definitions Define exactly which dates fall into low-, mid-, and high-season. The system automatically applies the correct rate based on stay dates.
Contract-specific rates Each TO can have their own contracted rates per season. The system tracks which operator has which rate and ensures the correct price is quoted every time.
Year-on-year comparison Compare contracted rates across years. See at a glance whether you're giving TUI a better or worse rate than last year, and by how much.
Future Value

Infrastructure That Grows with You

The strategic position: Dynamic pricing is forward-looking infrastructure. Today, most WESS revenue comes from TO contracts with fixed rates. But the direct channel is growing, and every point shifted from TO to direct means higher margins and more pricing flexibility. The engine is ready when the market catches up.

Year 1: Dynamic pricing on OTA/direct channels. Even a small share benefits from demand-based pricing. Foundation is laid.
Years 2–3: As the website and direct booking engine drive more direct traffic, the dynamic engine has more inventory to optimize. Revenue impact grows proportionally.
Long-term: Revenue intelligence layer on top: demand forecasting, market segment analysis, pickup pace tracking. The data accumulated by the pricing engine becomes an asset for strategic pricing decisions across all channels, including TO negotiations.

Staff Training and SOPs
€10,000 included
Custom SOP platform built for your departments. Standardized procedures, onboarding checklists, and video guides accessible from any device. Updated centrally across all properties.

If you did everything on this page

Total setup (one-off)
from €105,500

€4,350

These are not final prices.

Final scope and cost will depend on the discovery. Some items will come in lower, some may adjust. Nothing is committed until we scope it together.

Something We Could Explore

A Purchasing &

Inventory System

We know Material Control is being phased out and that the alternative under consideration has infrastructure concerns. If replacing your purchasing system is something you want to explore, it is something we could potentially take on, but only after we properly understand the problem.

What that would look like

A dedicated process mapping exercise: how purchasing works today, who approves what, how suppliers receive orders, how stock is tracked across outlets
Structured questions with your F&B and procurement teams to understand what the ideal system would look like for WESS specifically
An honest assessment from us on whether we could build it effectively, or whether a specialist procurement platform would be the better fit
If we take it on: a scoped proposal with realistic timelines, built around how your operation actually runs

This is not part of the core proposal. It is a conversation we are happy to have if it is something you want to explore down the line.

Next Step

Let’s Get the

Discovery Booked

A short video call with the right people. We will walk through how bookings, rates, and tour operator communications will work, and confirm what needs to be in place before November.
